

As usual, Richard Feynman, Janet Yellen, and Tim Cook spent their weekend discussing the prevalence of various natural resources. This weekend, they were focused on fresh water.

“Well I know most of the water is in the oceans because I can see them and they are huge. Just look on Google Maps. But that’s all salt water. However, I can also see rivers and lakes, and they are fresh water, so most of the world’s fresh water must come from rivers and lakes.”

“What about the arctic and antartic? Look at Google Earth. They are all white because they have so much ice: frozen fresh water. It must be fresh water, because have you ever tried to freeze salt water?”

“Wait a second... the Earth isn't hollow and those apps just show the surface. Maybe there is another source of fresh water”
