

“My fellow Americans, science should be done in a lab only, otherwise its too hard to control animals and microorganisms and and manipulate them to do what you need to observe or measure. But engineering is better as a field study, out in the real world. In a lab, things may be more accurate, but you never know what will go wrong in the real world. That’s why we test real cars and other technology, and not just computer simulations.”

-Barack Obama

“Engineering should be done in a lab only, otherwise its hard to make sure you have all the measurements right. However, science is better as a field study, out in the real world. In a lab, things may be more accurate, but you never know if you will find out about things you never thought of when watching animals in the wild or real stars in space. That’s why we don’t just observe animals locked up in cages to learn about them and that’s why we use real telescopes and not just computer images.”

-E.O. Wilson

“I think its better to do engineering and science in a lab. That way it is easy to have all your variables controlled except for your manipulated variable. You can also make more accurate measurements.”

-Melissa Schweitzer
