

As usual, Neil, LaMarcus, and Bill spent their weekend together discussing how the big bang eventually led to life on Earth. Explain whose ideas you do and don't agree with.

“When the big bang happened it made things really hot, and so we got stars because stars are hot. Then we got life because life likes hot places.”

“Well the big bang spread matter way out, then gravity made it more dense. We eventually got very dense objects such as some stars which released energy, and some of that energy was in the form of light. That's good for producers and then consumers and death and decomposers...”

“I agree with you LaMarcus, but I want to add that it all just ends in death and heat
