

As usual, Richard Feynman, Janet Yellen, and Tony Hsieh spent their weekend staring dreamily at the night sky. As they thought about what they saw, they all made several claims about the heavens above them. Explain which claims you do and don't agree with.

“I see all these little beautiful points of light that weren't there in the daytime. I wonder what they are - maybe little planets. And where in the world do they go during the daytime? There must just only be stars on one side of the earth.”

“Richard, I think it's the sun that is blocking them all. It is so big, that you can't see the other stars behind it. And yes, those other little dots of light are stars too.”

“Well I don't think the sun blocks them during the day by being in front of them, it's just that we're so close to it that the light like floods them out. Like you wouldn't notice a flashlight miles away if someone was shining another at you right next to your face.”
